Convert HTML to PDF in Python with 5 Popular Libraries (Updated 2025)

By Manoj Ahirwar

iii January 6, 2025(https://apitemplate.io/2025/01/06/)

We often encounter the need to create PDFs based on content. While there is no right or wrong way to generate PDFs, some approaches are more efficient and quicker to build than others.

Previously, we had to write all the boilerplate code to generate PDFs in our applications.

However, now we have many great libraries and tools that the use of ALL the cookies implement this feature.

The most important part of generating PDFs is the input Td and The infost info

In this article, we will look into some approaches that we can take to generate PDFs from HTML.

TL;DR: We provide a robust REST API (https://apitemplate.io/apiv2/) designed for seamless PDF generation with popular programming languages like Python. In addition, our free HTML to PDF converter (https://apitemplate.io/pdf-tools/convert-html-to-pdf/) lets you instantly transform HTML into high-quality PDFs. Try our free HTML to PDF converter (https://apitemplate.io/pdf-tools/convert-html-to-pdf/) online today!

HTML to PDF using APITemplate.io

- i. Template-based PDF generation
- ii. Generate PDF from the website URL
- iii. Generate PDF from custom HTML content

Conclusion

Why generate PDF from HTML?

Before we move on to the libraries, first let's see why we prefer HTML as input data for generating PDFs. Some of the reasons are as follows

- 1. Open and Mature Technology: HTML is an open standard, which ensures that tools and technologies built around it are widely available and well-understood. Its maturity also means that most of the challenges and quirks are well-documented, making troubleshooting easier.
- Cost-effective: There are a plethora of tools, libraries, and APIs available (both free and paid) that can convert HTML to PDF, reducing the need for specialized software for PDF creation.
- 3. **Embed Multimedia**: HTML supports the embedding of multimedia such as images, videos, and audio. Although not all of these can be directly translated into a PDF, having a source in HTML provides options for creating rich, multimedia-enhanced documents.
- 4. **Styling with CSS**: Cascading Style Sheets (CSS) provide powerful styling options for HTML content, allowing for branding, theming, and visual consistency. These can then be reflected in the resulting PDF.
- 5. Easy to Learn and Use: Learning the basics of HTML can be done quickly, making it accessible for many users to create content.

In summary, converting PDFs from HTML combines the best of both worlds: the flexibility, accessibility, and interactivity of HTML with the portability and Standardization of PDFs.

HTML to PDF using Python Libraries

There are many libraries available in Python that allow the generation of Politicing HTML content, some of them are explained below.

We use cookies on our website to give you the most relevant experience by remembering your hegeneration of platsitions you clicking "Accept All", you consent to the use of ALL the cookies

When generating HTML to PDF in Python, we need libraries and solutions which does not compromise the formatting of the PDF. With the formatting of the PDF. With the cookies and the processing libraries you don't need to worry about losing formatting pecauses and the processing solutions take care of the formatting when generating HTMMLCAPPIDE using Python. (https://apitemplate.io/privacy-policy/).

i. Pyppeteer

Pyppeteer (https://github.com/pyppeteer/pyppeteer) is a Python port of the Node library Puppeteer, which provides a high-level API over the Chrome DevTools Protocol. it's like you are running a browser in your code that can do similar things that your browser can do. Puppeteer can be used to scrap data from websites, take

to generate PDFs from HTML.

First, we need to install pyppeteer with the following command:

pip install pyppeteer	Сору	

screenshots for a website, and much more. Let's see how we can utilize pyppeteer

Generate PDF from a website URL

```
import asyncio
from pyppeteer import launch

async def generate_pdf(url, pdf_path):
    browser = await launch()
    page = await browser.newPage()

    await page.goto(url)

    await page.pdf({'path': pdf_path, 'format': 'A4'})

    await browser.close()

# Run the function
asyncio.get_event_loop().run_until_complete(generate_pdf('https://example.
```

In the above code, if you see the generate_pdf method, we are doing the following things

- 1. Launching a new headless browser instance
- 2. Opens a new tab or page in the headless browser and waits for it to be ready.
- 3. Navigate to the URL specified in the url argument and wait for the page to load.
- 4. Generates a PDF of the webpage. The PDF is saved at the location specified in pdf_path , and the format is set to A4 .

We use cookies on our website to

give you the most relevant

5. Closes the headless browser.

Generate PDF from Custom HTML content

```
experience by remembering your
                                                       preferences and repeat visits. By
                                                       clicking "Accept All", you consent
import asyncio
                                                       to the use of ALL the cookies
from pyppeteer import launch
async def generate_pdf_from_html(html_content, pdfogethm)ore information about
                                                       these cookies and the processing
    browser = await launch()
                                                       of your personal data, check our
    page = await browser.newPage()
                                                       Privacy Policy
(https://apitemplate.io/privacy-
                                                       policy/)
    await page.setContent(html_content)
    await page.pdf({'path': pdf_path, 'format': 'A4'})
                                                                              Accept All
    await browser.close()
# HTML content
html_content = '''
<!DOCTYPE html>
<html>
<head>
    <title>PDF Example</title>
</head>
<body>
     -h1-Unlla vanldt-/h1-
```

Above is another example using Pyppeteer on how we can use our own custom HTML content to generate PDFs. Let's see what is happening in the method generate_pdf_from_html

- 1. Launching a new headless browser instance
- 2. Opens a new tab or page in the headless browser and waits for it to be ready.
- 3. Now we are explicitly setting the content of the page to our HTML content
- 4. Generates a PDF of the webpage. The PDF is saved at the location specified in pdf_path, and the format is set to 'A4'.

5. Closes the headless browser.

ii. xhtml2pdf

xhtml2pdf (https://xhtml2pdf.readthedocs.io/en/latest/) is another Python library that lets you generate PDFs from HTML content. Let's see xhtml2pdf in action.

The following command is to install xhtml2pdf:

```
pip install xhtml2pdf requests
```

To generate PDF from a website URL

Note that xhtml2pdf does not have an in-built feature to parse the URL, but we can use requests in Python to get the content from a URL.

```
Сору
from xhtml2pdf import pisa
import requests
def convert_url_to_pdf(url, pdf_path):
    # Fetch the HTML content from the URL
    response = requests.get(url)
    if response.status_code != 200:
         print(f"Failed to fetch URL: {url}")
         return False
    html_content = response.text
                                                       We use cookies on our website to
    # Generate PDF
                                                       give you the most relevant
    with open(pdf_path, "wb") as pdf_file:
                                                       experience by remembering your
         pisa_status = pisa.CreatePDF(html_content_preferences_afiel@peat visits.By
                                                       clicking "Accept All", you consent
                                                       to the use of ALL the cookies
    return not pisa_status.err
# URL to fetch
                                                       To get more information about
url_to_fetch = "https://google.com"
                                                       these cookies and the processing
                                                       of your personal data, check our
                                                       <u>Privacy Policy</u>
(https://apitemplate.io/privacy-
# DDE nath to cave
```

In the above code, we are doing the following things in out method convert_url_to_pdf

- 1. First, we are using requests to get the webpage content from the URL. Accept All
- 2. Once we get the content, we select the text part from the response using response.text
- 3. Now the generating PDF part comes, we are using pisa.CreatePDF and pass our HTML content and PDF file name for the output.

Generating PDF from custom HTML content

```
Сору
from xhtml2pdf import pisa
def convert_html_to_pdf(html_string, pdf_path):
    with open(pdf_path, "wb") as pdf_file:
        pisa_status = pisa.CreatePDF(html_string, dest=pdf_file)
    return not pisa_status.err
# HTML content
html_content = '''
<!DOCTYPE html>
<html>
<head>
    <title>PDF Example</title>
</head>
<body>
    <h1>Hello, world!</h1>
</body>
</html>
# Canarata DDE
```

Generating PDF from custom HTML content is also similar to what we have done for the URL part, the only change here is, that we are passing the actual HTML content to our generating method. Now it will use our custom HTML content and generate PDF from it.

iii. python-pdfkit

python-pdfkit (https://pypi.org/project/pdfkit/) is a python wrapper for wkhtmltopdf We use cookies on our website to

utility to convert HTML to PDF using Webkit.

First, we need to install python-pdfkit with pip:

give you the most relevant experience by remembering your preferences and repeat visits. By clicking "Accept All", you consent to the use of ALL the cookies

pip install pdfkit

To get more information about these cookies and the processing of your personal data, check our <u>Privacy Policy</u> (https://apitemplate.io/privacy-

To generate PDF from website URL

policy/) Сору import pdfkit Accept All def convert_url_to_pdf(url, pdf_path): try: pdfkit.from_url(url, pdf_path) print(f"PDF generated and saved at {pdf_path}") except Exception as e: print(f"PDF generation failed: {e}") # URL to fetch url_to_fetch = 'https://example.com' # PDF path to save pdf_path = 'example_from_url.pdf' # Generate PDF convert_url_to_pdf(url_to_fetch, pdf_path)

pdfkit supports generating PDFs from website URLs out of the box just like Pyppeteer.

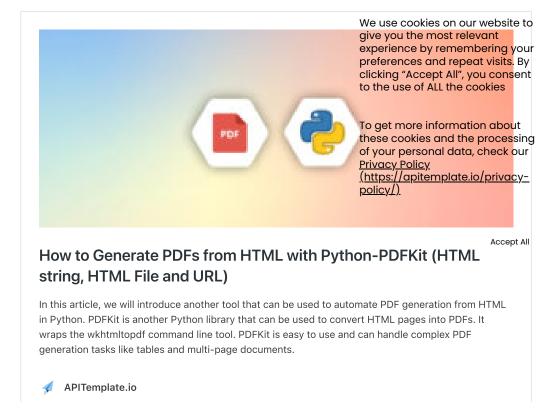

In the above code, as you can see, pdfkit is generating pdf just from one line code. pdfkit.from_url is all you need to generate a PDF.

Generating PDF from custom HTML content

```
import pdfkit
                                                                       Сору
def convert_html_to_pdf(html_content, pdf_path):
    trv:
        pdfkit.from_string(html_content, pdf_path)
        print(f"PDF generated and saved at {pdf_path}")
    except Exception as e:
        print(f"PDF generation failed: {e}")
# HTML content
html_content = '''
<!DOCTYPE html>
<html>
<head>
    <title>PDF Example</title>
</head>
<body>
    <h1>Hello, world!</h1>
</body>
</html>
```

For generating PDF from custom HTML content, we only need to use pdfkit.from_string and provide HTML content and a pdf file path.

We find out more about python-pdfkit, we have a detailed article in the following link:

iv. Playwright

Playwright is a modern and lightweight library for using a headless browser in your application. Playwright is primarily used in automation testing with its powerful offering of integrations with modern browsers. Currently, Playwright supports Firefox, Chromium, Edge & Safari. Playwright is Cross-platform, cross-browser, and cross-language.

In this article, we will look into how we can convert HTML to PDF in Python using Playwright without losing formatting and quality.

the first step is to install the Playwright library

```
pip install playwright
                                                                        Сору
playwright install
```

playwright install command will make sure to install a headless browser in your system which will be used to convert HTML to PDF in Python.

Generate PDF from website URL

```
Copy
import asyncio
from playwright.async_api import async_playwright
async def url_to_pdf(url, output_path):
    async with async_playwright() as p:
        browser = await p.chromium.launch()
        page = await browser.new_page()
        await page.goto(url)
        await page.pdf(path=output_path)
        await browser.close()
# Example usage
url = 'https://google.com'
output_path = 'html-to-pdf-output.pdf'
                                                    We use cookies on our website to
                                                    give you the most relevant
asyncio.run(url_to_pdf(url, output_path))
                                                    experience by remembering your
                                                    preferences and repeat visits. By
                                                    clicking "Accept All", you consent
```

In the above code, we have url_to_pdf method which takes the URL of the website and output path as input parameters. It creates an async function to run a headless To get more information about browser.

we use chromium.launch() to launch a new instance of the decrease and create a new page with browser.new_page()

these cookies and the processing your personal data, check our (https://apitemplate.io/privacypolicy/)

once we have a new page ready, we then load our URL which will be the source for HTML to PDF in this case. Once everything is done, we call browser.close() to close the browser instance.

Generate PDF from custom HTML content

We can also use Playwright to generate custom HTML to PDF along with directly loading HTML content from the website URL. To generate HTML to PDF from your custom HTML, we will do the following

```
Сору
import asyncio
from playwright.async_api import async_playwright
async def html_to_pdf(html_content, output_path):
    async with async_playwright() as p:
        browser = await p.chromium.launch()
        page = await browser.new_page()
        await page.set_content(html_content)
        await page.pdf(path=output_path)
        await browser.close()
html_content = '''
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <title>Sample HTML</title>
</head>
<body>
    <h1>Hello, World!</h1>
```

In the above code snippet, we are passing our custom HTML content to html_to_pdf method. We use Playwright to load that custom HTML in a new tab of the headless browser, and then generate PDFs using our custom HTML.

v. WeasyPrint

WeasyPrint (https://weasyprint.org/) is a visual rendering engine that converts

HTML and CSS into PDFs, focusing on adhering to web standards for printing. It is
freely available under a BSD license.

We use cookies on our website to give you the most relevant

Unlike some other libraries which rely on browsers such preference by remembering your preferences and repeat visits. By built on several libraries but does not use a full rendering lie kigime. Ccept All", you consent to the use of ALL the cookies

In this section, we will look into how we can use WeasyPrint to convert HTML to

PDF using Python.

To get more information about these cookies and the processing of your personal data, check our Privacy Policy (https://apitemplate.io/privacy-policy/).

Install WeasyPrint

pip install WeasyPrint Copy Accept All

Generate PDF from website URL

To generate a PDF from the website URL, we will use .HTML() method given by the WeasyPrint library.

```
from weasyprint import HTML

def url_to_pdf(url, output_path):
    HTML(url).write_pdf(output_path)

# Example usage
url = 'https://google.com'
output_path = 'output_url.pdf'

url_to_pdf(url, output_path)
```

In the above code snippet, we are using the WeasyPrint .write_pdf() method which converts the Website URL to PDF in a simple step.

While using WeasyPrint, we don't need to worry about setting up any other things and we can just call the method and get PDFs directly from the website URL.

Generate PDF from custom HTML content

```
Сору
from weasyprint import HTML
def html to pdf(html content, output path):
    HTML(string=html_content).write_pdf(output_path)
html_content = '''
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <title>Sample HTML</title>
</head>
<body>
    <h1>Hello, World!</h1>
    This is a sample HTML content to be converted to PDF.
</body>
</html>
output_path = 'output_html.pdf'
html to ndf(html content output nath)
```

We use cookies on our website to Same as generating PDFs from website URL, we can use in the custom HTML and then use .write_pdf() method to creation with the custom HTML and then use .write_pdf() method to creation with the custom HTML.

We use cookies on our website to the use cookies our website to the use

To get more information about these cookies and the processing of your personal data, check our Privacy Policy (https://apitemplate.io/privacy-

Comparison of All 5 Popular Libraries (https://apitemplate.io/privacy-policy/).

While all of these tools serve the primary purpose of HTML to PDF conversion, each brings its unique features and approaches to the table.

Below is a detailed tabular comparison to help you choose the right tool for your needs.

Feature/Asp ect	Pyppeteer	xhtml2pdf	python- pdfkit	Playwright	WeasyPrint
Nature	Browser automation library	HTML/CSS to PDF converter	Wrapper around wkhtmltopdf	Lightweight and Modern Browser automation library	Document factory to create PDF documents easily

Feature/Asp ect	Pyppeteer	xhtml2pdf	python- pdfkit	Playwright	WeasyPrint
Based On	Puppeteer (Chromium headless)	ReportLab & html5lib	wkhtmltopdf	Playwright (supports Firefox, Chromium, Edge & Safari)	Written in Python and based on various libraries and not a full rendering engine
Dependenci es	Requires Chrome/Chr omium	Python libraries	Requires wkhtmltopdf	Cross- browser support	Python libraries
Language	Python	Python	Python	Python	Python
Javascript Support	Yes (full browser environment)	No	Yes (limited, via wkhtmltopdf)	Yes (full browser environment)	No
CSS Support	Full (as in Chrome)	Limited	Good (via wkhtmltopdf)	Full (as in browser)	Yes
Performanc e	May be slower (full browser)	Moderate	Fast (native conversion)	Fast	Fast
Ease of Setup	Moderate (need Chromium)	Easy (pure Python)	Moderate (requires wkhtmltopdf)	Easy to We'use cookies of give you the most experience by re preferences and	st relevant membering you repeat visits. By
API Flexibility	High (full browser automation)	Moderate (focused on PDF)	Moderate (wrapper around tool)	clicking "Accept to the use of ALL cross- browser To get more info the second are	Python API rmation about d the processin
Usage	Good for complex web content, SPA, dynamic JS content	Good for simpler HTML/CSS docs	Common for various HTML to PDF tasks	of your personal Good folicy (https://apitempolicy/) automation testing with support of all modern browser	data, check our Good for late ad privesy- documents with rich styling Accept Al

In conclusion, the choice between Pyppeteer, Playwright, xhtml2pdf, WeasyPrint, and python-pdfkit depends on the specific requirements of your project.

While Pyppeteer excels at handling dynamic content due to its full browser automation capabilities, xhtml2pdf offers a straightforward, Python-centric solution for basic conversions.

Playwright is a serious alternative to Pyppeteer as Playwright solves the problems that developers face while using Pupeteer. With the Playwright you get to experience a lightweight and fast library that has support for all the modern browsers.

WeasyPrint is a developer-friendly Python library that does not let you sweat over configurations and setup. One thing to take note is that WeasyPrint is based on various libraries and not a full rendering engine like WebKit or Gecko, so it doesn't support Javasacript.

Python-pdfkit, wrapping around wkhtmltopdf, stands as a versatile middle ground. Developers should weigh the features, setup complexities, and performance of each library against their project's demands to determine the best fit.

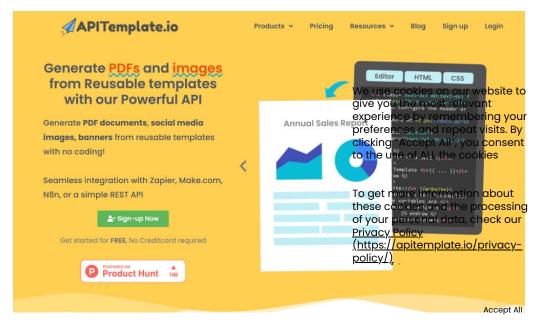

In summary, if you need to render complex HTML, CSS, and JavaScript with full browser compatibility, consider using Pyppeteer, Playwright, or python-pdfkit. For simpler tasks, xhtml2pdf and WeasyPrint are more suitable options.

HTML to PDF using APITemplate.io

Above are some examples of how we can use libraries to convert HTML to PDF and web pages to PDF. but when it comes to generating PDFs using templates or keeping track of generated PDFs, we need to do a lot of extra things to handle all those.

We need to have our own generating pdfs tracker for tracking the files generated. Or if we want to use custom templates such as Invoice generators, we need to create and manage those templates.

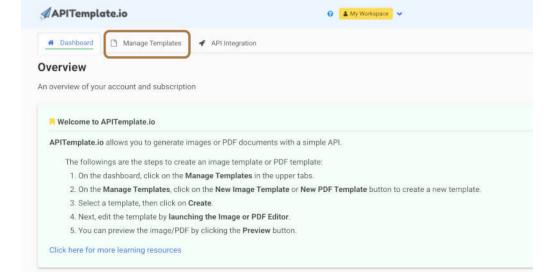

APITemplate.io (https://apitemplate.io)is an API-based platform for PDF generation, perfect for the use cases mentioned. Our PDF generation API (https://apitemplate.io/pdf-generation-api/) uses a Chromium-based rendering engine, which fully supports JavaScript, CSS, and HTML.

Let's see how we can utilize APITemplate.io (https://apitemplate.io/) to handle generating PDFs

Template-based PDF generation

APITemplate.io (http://ApiTemplate.io) allows you to manage your templates. Go to Manage Templates from the dashboard

From Manage Template, You can create your own templates. Following is the sample Invoice template. There are lots of templates available that you can choose and customize based on your requirements.

We use cookies on our website to give you the most relevant experience by remembering your preferences and repeat visits. By clicking "Accept All", you consent to the use of ALL the cookies

To start using APITemplate.io (http://APITemplate.io) APtae footbase footba

To get more information about Ptap Your personal data, check our Privacy Policy (https://apitemplate.io/privacy-policy/).

Accept All

Now that you have your APITemplate account ready, let's get to some actions and integrate it with our application. We will be using the template to generate PDFs.

```
Сору
import requests
import json
# Initialize HTTP client
client = requests.Session()
# API URL
url = "https://rest.apitemplate.io/v2/create-pdf?template_id=YOUR_TEMPLATE
# Payload data
payload = {
    "date": "15/05/2022",
    "invoice_no": "435568799",
    "sender_address1": "3244 Jurong Drive",
    "sender_address2": "Falmouth Maine 1703",
    "sender_phone": "255-781-6789",
    "sender_email": "hello@logos.com",
    "rece_addess1": "2354 Lakeside Drive",
    "rece_addess2": "New York 234562",
    "rece_phone": "34333-84-223",
    "rece_email": "business@apitemplate.io",
```

and If we check response_string we have the following

```
"download_url":"PDF_URL",
   "transaction_ref":"8cd2aced-b2a2-40fb-bd45-392c777d6f6",
   "status":"success",
   "template_id":"YOUR_TEMPLATE_ID"
}
```

We use cookies on our website to convey the most partial and other library. Just need to calk partial each preferences and repeat visits. By clicking "Accept All", you consent to the use of ALL the cookies

You can use the download_url from the response to download or distribute the generated PDF.

To get more information about these cookies and the processing of your personal data, check our Privacy Policy (https://apitemplate.io/privacy-policy/).

ii. Generate PDF from the website URL

APITemplate also supports generating PDFs from website URLs.

```
AGGept All
import requests, json
def main():
    api_key = "YOUR_API_KEY"
    template_id = "YOUR_TEMPLATE_ID"
    data = {
      "url": "https://en.wikipedia.org/wiki/Sceloporus_malachiticus",
      "settings": {
        "paper size": "A4",
        "orientation": "1",
        "header_font_size": "9px",
        "margin_top": "40",
        "margin_right": "10"
        "margin_bottom": "40",
        "margin_left": "10",
        "print_background": "1",
        "displayHeaderFooter": true,
        "custom_header": "<style>#header, #footer { padding: 0 !important;
        "custom_footer": "<style>#header, #footer { padding: 0 !important;
      }
```

In the above code, we can provide the URL in the request body along with the settings for the PDF. APITemplate will use this request body to generate a PDF and will return a download URL for your PDF.

iii. Generate PDF from custom HTML content

If you want to generate PDFs using your own custom HTML content, APITemplate supports that as well.

```
Сору
import requests, json
def main():
    api_key = "YOUR_API_KEY"

PDF generation is now part of every business applicatio hape heads where developers sweat.

We have seen how we can use third-party libraries to generate PDFs if our use case is simple. But also if we have complex use cases such as maintaining templates, ppt All then APITemplate.io (https://apitemplate.io/) provides the solution just for that using simple API calls.

Sign up for a free account (https://app.apitemplate.io/accounts/signup/) with us now and start automating your PDF generation. (https://apitemplate.io/pdfgeneration-api/)

Libraries:

- REST API Reference (https://apitemplate.io/apiv2/)
- Javascript Client Library (https://github.com/APITemplate-io/apitemplateio-
- Python Client Library (https://github.com/APITemplate-io/apitemplateiopython)
- Java Client Library (https://github.com/APITemplate-io/apitemplateio-java)
- PHP Client Library (https://github.com/APITemplate-io/apitemplateio-php)
- C# Client Library (https://github.com/APITemplate-io/apitemplateio-csharp)

Manoj Ahirwar

Hi, I'm Manoj. I am building SaaS products. I love writing about my journey as well as writing on technical stuff. I am also trying to travel to as many countries as I can:)
